# Autómatas celulares 2D y 3D

Grupo 7 Duffau, Teófilo Manuel Lynch, Ezequiel

#### Introducción

- El juego de la vida es un autómata celular 2d que se basa en la evolución de una población según cuantos vecinos vivos tenga cada individuo
- La regla principal es 2333, que significa que los individuos sobreviven si la cantidad de vecinos está entre 2 y 3 (primeros 2 dígitos) y que los individuos muertos nacen si la cantidad de vecinos está entre 3 y 3 (últimos 2 dígitos)
- Para este trabajo se investigaron distintas reglas para 2d y 3d

### Modelo

- 1. LifeParticles2D y 3D
- 2. Grids 2D y 3D
- 3. Simulator

### **Implementación**

- 1. Población de la grilla
- 2. Cálculo de vecinos
- 3. Iteración

#### Resultados

25 simulaciones en cada uno de los conjuntos de reglas seleccionados.

Reglas en 2D:

1. 2333

2. 2336

3. 3422

4. 3434

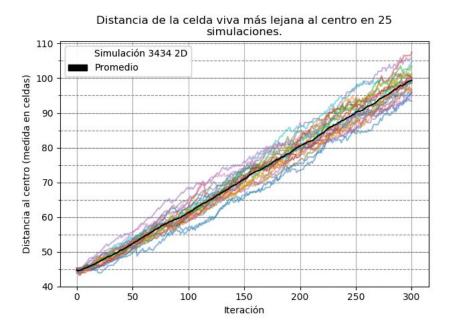

Reglas en 3D:

1. 4555

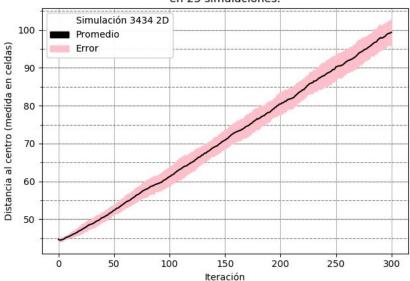

2. 5746

3. 5766

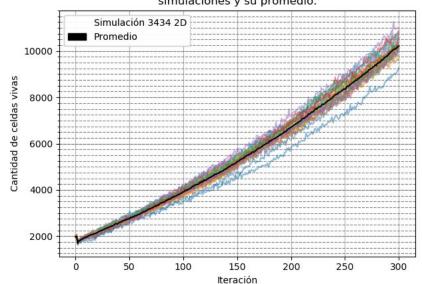

### Regla 2D: 2333 (Conway's Game of Life)

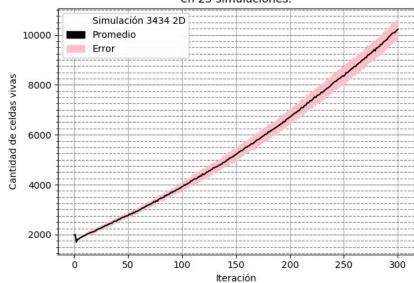

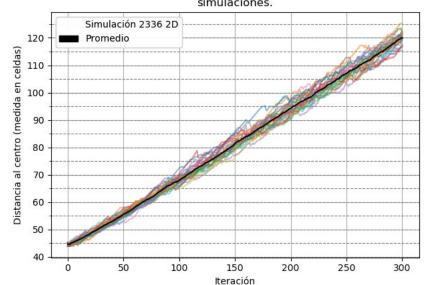

Cantidad de celdas vivas a lo largo del tiempo en 25 simulaciones y su promedio.

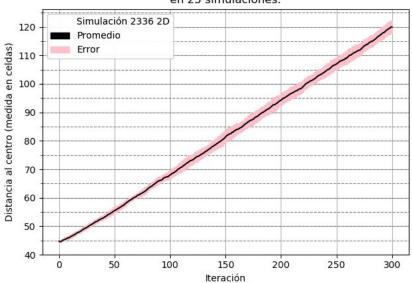

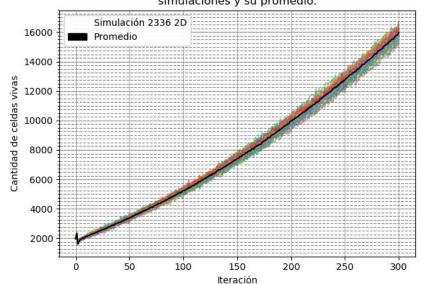

### Regla 2D: 2336 (HighLife)

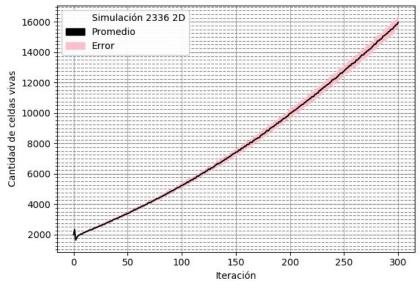

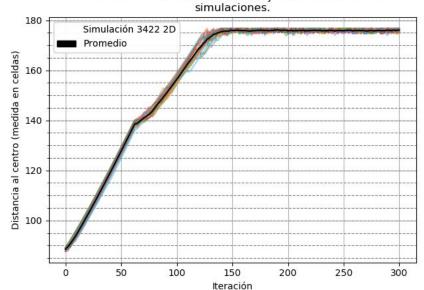

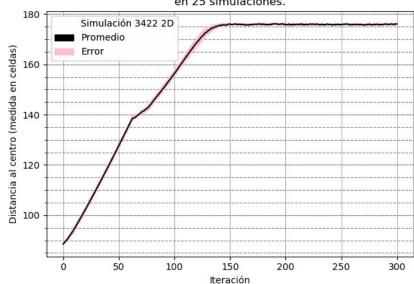

Cantidad de celdas vivas a lo largo del tiempo en 25 simulaciones y su promedio.

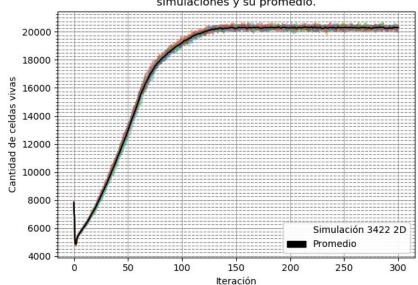

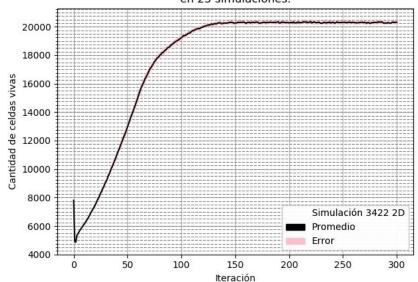

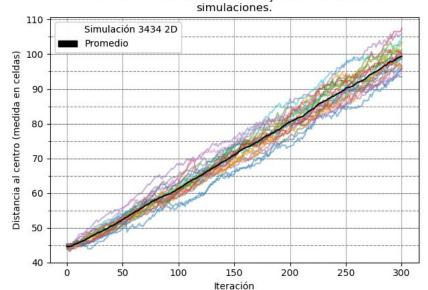

Cantidad de celdas vivas a lo largo del tiempo en 25 simulaciones y su promedio.

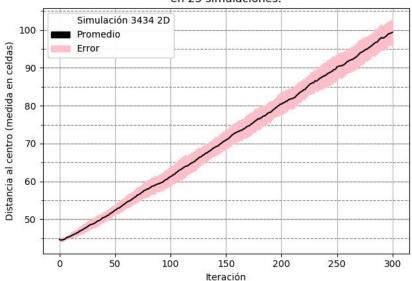

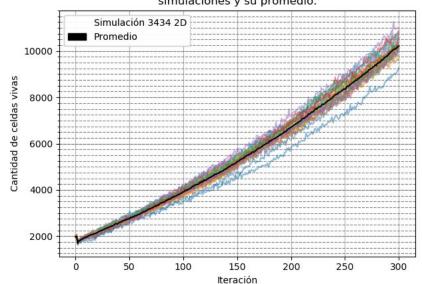

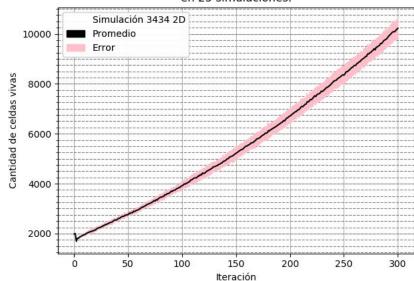

Distancia de la celda viva más lejana al centro en 25

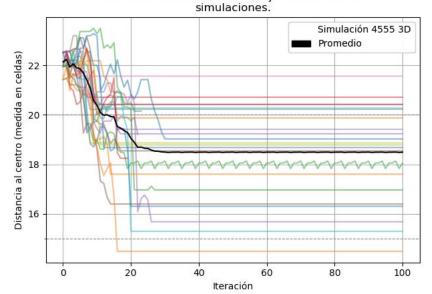

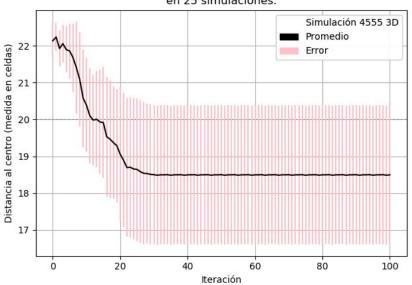

Cantidad de celdas vivas a lo largo del tiempo en 25 simulaciones y su promedio.

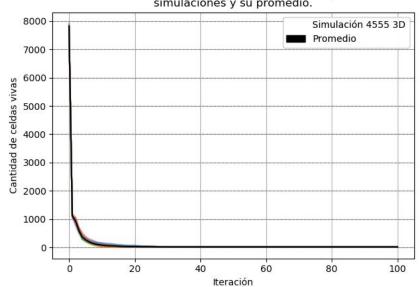

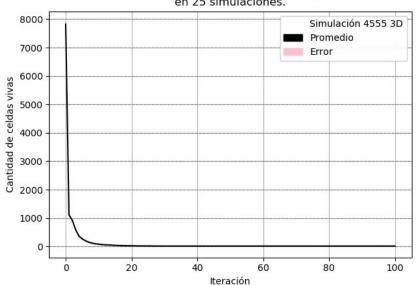

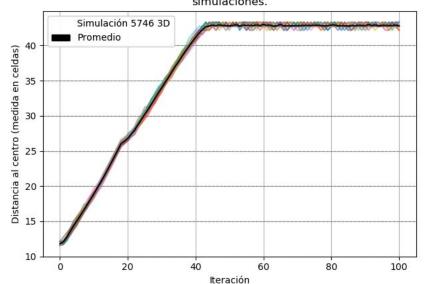

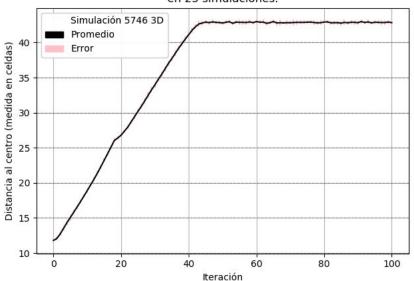

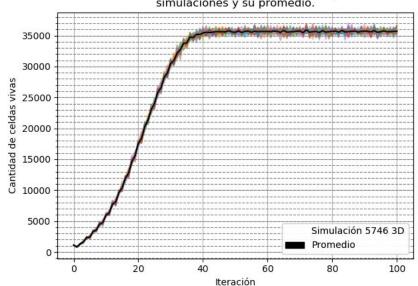

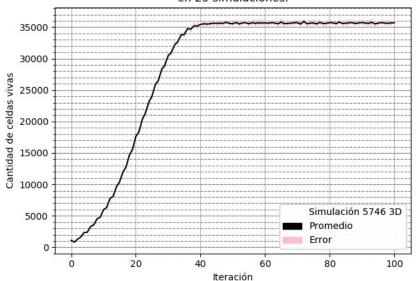

Distancia de la celda viva más lejana al centro en 25 simulaciones.

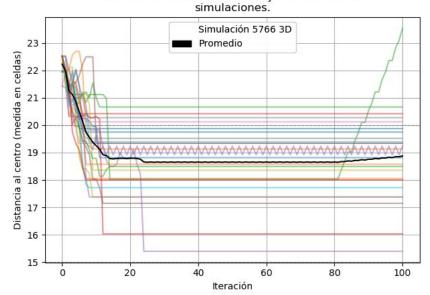

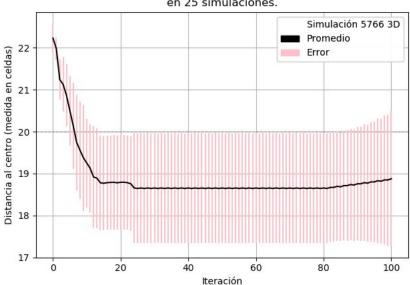

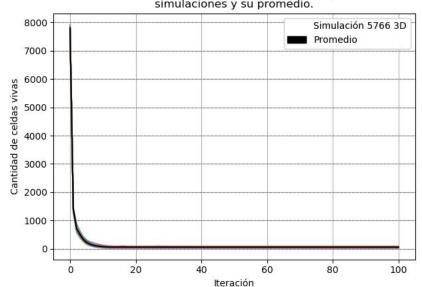

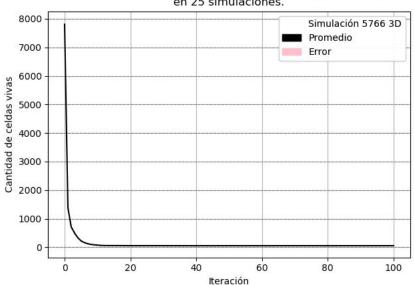

### **Conclusiones**

- 1. Tipos de sistemas
- 2. Crecimiento
